/clone lib="potato abiotic stress cDNA library"
/note="Vector: pCMVSport6.1; Site_1: EcoRI; Site_2: NotI;
supplier: Solanum tuberosum var. Kennebec plants were
grown from cuttings on a 16hr light/8 hr dark cycle at 25
C for 3-4 weeks. Abiotic stress conditions were applied to
four separate sets of plants. Set 1 involved saturation of
the soil with 150 mM NaCl and tissues were harvested at
following application of the salt stress (leaves: 2hr,
6hr, 11hr, 1d, 2d, and 4d; roots:2hr, 6hr, 11hr, and 2d).
Set 2 were grown under the standard conditions and then
were water stressed by withdrawal of further watering
applications. Drought stressed plants were harvested after
cessation of watering (leaves: 3d, 5d, and 7d; roots:3d
and 5d). Set 3 were grown under the standard conditions
and then were cold stressed by placement at 4 C. Cold
stressed leaves were harvested at 2 hr, 6 hr, 12 hr, 1 d,
and 4d and roots were harvested at 2 hr, 6 hr, 12 hr, 1 d,
2d. Set 4 were grown under the standard conditions and
then were has stressed by placement at 35 C. Heat
stressed leaves were harvested at 2 hr, 6 hr, 12 hr, 1 d,
2d and 4d and heat-stressed roots were harvested at 6 hr,
12 hr, 1 d, and 4d, RNA was isolated from all tissues and
equal RNA from each tissue and stress was pooled to
construct the cDNA library. RNA sample."

flower buds, leaves and roots"

//lab host="DHIOB TI (Tl and T5 phage resistance)"
//clome libs"*Aquilegia cDNA library"
//note="Vector: pCMV SPORT6.1; Site 1: ECORI; Site 2: NotI;
F2, F3, and F4 lines of Aquilegia Formosa X A. pubescens
were grown from seed in greenhouses at UC Santa Barbara.
From these plants three sets of tissue were collected: 1)
Small flower buds (<10 mm) and very young inflorescences
(71 & 29% by weight respectively), 2) Medium (7-20 mm) and
large (at or near anthesis) flower buds (65 & 35% by
weight respectively) and 3) Shoot apical meristens. A
fourth set of tissue was collected from plants of A.
formosa. These plants were grown from seed in sand and at
approximately 1 month root tissue and leaf tissue of
various developmental stages were collected from each
set of tissue and pooled in the following proportions:
1.5X from sets 1 & 2, 1X from sets 3 & 4. From the pooled
total RNA, mRNA was extracted and enriched for full-length
messages and then normalized with proprietary methods by
Invitrogen."

/note="Vector: pCMVSport6.1; Site 1: EcoRI; Site 2: NotI;
supplier: Solanum tubercosum var. Kennebec plants were
grown from cuttings on a 16hr light/8 hr dark cycle at 25
C for 3-4 weeks. Abiotic stress conditions were applied to
four separate sets of plants. Set 1 involved saturation of
the soil with 150 mM NaCl and tissues were harvested at
following application of the salt stress (leaves: 2hr,
6hr, 12hr, 1d, 2d, and 4d; roots: 2hr, 6hr, 12hr, and 2d).
Set 2 were grown under the standard conditions and then
were water stressed by withdrawal of further watering
applications. Drought stressed plants were harvested after
cessation of watering (leaves: 3d, 5d, and 7d; roots:3d
and 5d). Set 3 were grown under the standard conditions
and then were cold stressed by placement at 4 C. Cold
stressed leaves were harvested at 2 hr, 6 hr, 12 hr, 1 d,
and 4d and roots were harvested at 2 hr, 6 hr, 12 hr, 1 d,
and 4d and roots were harvested at 2 hr, 6 hr, 12 hr, 1 d,
2d and 4d and heat-stressed by placement at 35 C. Heat
stressed leaves were harvested at 2 hr, 6 hr, 12 hr, 1 d,
2d and 4d and heat-stressed serves harvested at 2 hr, 6 hr, 12 hr, 1 d,
2d and 4d and heat-stressed roots were harvested at 6 hr,
12 hr, 1 d, and 4d. RNA was isolated from all tissues and
equal RNA from each tissue and stress was pooled to
construct the cDNA library. RNA sample."

/note="Organ: Zygotic Embryos; Vector: pGADT7-ReCAB;
Site_1: EcoRI, Site_2: ClaI; Library enriched in
transcripts present in suspension culture of Loblolly Pine
(Pinus taeda L.), 7-56. Suspension culture was established
from fertilized megagametophytes, according to method of
Pullman et al 2003 (Pullman, G., S. Johnson, G. Peter, J.
Cairney, and N. Xu. 2003. Improving loblolly pine somatic
embryo maturation: Comparison of somatic and zygotic
embryo maturation: Comparison of somatic and zygotic
embryo morphology, germination, and gene expression. Plant
Cell Reports 21:747-758.) This suspension cell culture,
which contains early developing embryos and
undifferentiated embryogeneic tissue, was the source of
the RNA used for the suspension culture library.
Subtracted from this was cDNA made from a pool of RNA from
zygotic embryos and female gametophytes from all stages of
development plus somatic embryos from developmental stages
beyond susepension culture (see Ciavatta VT, Morillon R,
Pullman GS, Chrispeels M, Cairney J. 2001. An
aquaglyceroporin is abundantly expressed early in the
development of the suspensor and the embryo proper of
lobbolly pine (pinus taeda L.). Plant Physiol. 127:

Fruit was collected on October 22, 2003, between 8 to 9 am and stored at 4C. The flavedo tissue was dissected out of developing fruit (165 DAFB) and used to isolate RNA using Trizol reagent from Invitrogen. The cDNA Library was constructed using the SMART cDNA library Kit (Clontech). The primary library was en masse evicted and plasmid DNA containing the cDNA library was isolated from the resultant bacterial population. Plasmid DNA was then transformed into ultra competent E coli cells (XLIO Gold; Stratagene). Transformants were plated out on Q-trays (2000 cfu/tray), picked using a Qbot and archived in 384 well disches "
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             /lab_host="XL10-Gold"

//moll-type="mRNA"
//db_xref="taxon:338618"
//clone="COllG72"
//tlssue type="mixed shoot and floral apical meristems,
flower buds, leaves and roots"
//clone lib="Aquilegia CDNA library"
//clone lib="Aquilegia CDNA library"
//clone serotic: pCMV SPORT6.1; Site_1: EcoRI; Site_2: NotI;
//clone these plants three sets of tissue were collected: 1)
Small flower buds (<10 mm) and very young inflorescences
(71 & 29% by weight respectively), 2) Medium (7-20 mm)
large (at or near anthesis) flower buds (65 & 35% by
weight respectively) and 3) Shoot apical meristems. A
fourth set of tissue was collected from seed in sand and at
approximately 1 month root tissue and leaf tissue of
various developmental stages were collected from seach
set of tissue and pooled in the following proportions:
1.5X from sets 1 & 2, 1X from sets 3 & 4. From the pooled
tocal RNA, mRNA was extracted and enriched for full-length
messages and then normalized with proprietary methods by
Invitrogen."

suppliar: Solanum tuberosum var. Kennebec plants were
grown from cuttings on a 16hr light/8 hr dark cycle at 25
C for 3-4 weeks. Abiotic stress conditions were applied to
four separate sets of plants. Set 1 involved saturation of
the soil with 150 mM NaCl and tissues were harvested at
following application of the sail stress (leaves: 2hr,
6hr, 12hr, 1d, 2d, and 4d; rootes:2hr, 6hr, 12hr, and 2d).
set 2 were grown under the standard conditions and then
were water stressed by withdrawal of further watering
applications from the standard of further watering
applications. Drought stressed plants were harvested after cessation of watering (leaves: 3d, 5d, and 7d; roots:3d and 5d). Set 3 were grown under the standard conditions and then were cold stressed by placement at 4 C. Cold stressed leaves were harvested at 2 hr, 6 hr, 12 hr, 1 d, and 4d and roots were harvested at 2 hr, 6 hr, 12 hr, 1 d,

2d. Set 4 were grown under the standard conditions and then were heat stressed by placement at 35 C. Heat stressed leaves were harvested at 2 hr, 6 hr, 12 hr, 12d and 4d and heat-stressed roots were harvested at 6 h 12 hr, 1 d, and 4d. RNA was isolated from all tissues a equal RNA from each tissue and stress was pooled to construct the cDNA library. RNA sample." hr,

An Arabidopsis full-length conA library was constructed essentially
an Arabidopsis full-length conA library was constructed essentially
as reported previously (Seki et al., 1998).cDNA cleaved with BamHI
and XhoI was ligated to modified Lambda FIC-I vector (Carninci et
al., submitted for publication) digested with BamHI and SalI. This
clone is in a modified pBluescript vector. Please visit our web
site (http://www.gsc.riken.go.jp/e/plant/index _e.html) for further
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            details.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Genes with similarity to proteins in the databases are described as 'putative', '-like' or 'similar to'. Genes that have BST similarity but no significant protein similarity are described as 'unknown proteins'. Genes that are amoutated only on gene prediction software are described as 'hypothetical proteins'. The software programs used to predict genes include: Grail (Informatics Group, Oak Ridge National Laboratory, http://compbio.ornl.gov/section/index.html), GENSCAN (Chris Burge, http://gnomic.stanford.edu/~chris/GENSCANW.html), Fexa (V.Solovyev & A.Salamov, Sanger Centre, http://genomic.stanford.edu/~chris/GENSCANW.html), and NetPlantGene (S.M. Hebsgaard, et al., CBS, Technical University of Denmark,http://www.cbs.dtu.dk/NetPlantGene.html).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Direct Submission

On Jun 1, 2004 this sequence version replaced gi:34740243.
Genes were predicted from the integrated results of the following: GENSCAN (http://cCr.081.mit.edu/GENSCAN.html), FGENESH (http://www.softberry.com//, GeneMark/), GlimmerM (http://www.softberry.com//, GeneMark/), GlimmerM (http://cp.biology.gatech.edu/GeneMark/), GlimmerM (http://rgp.dna.affrc.go.jp/RiceHMM/), SplicePredictor (http://rgp.dna.affrc.go.jp/RiceHMM/), SplicePredictor (http://rgp.dna.affrc.go.jp/RiceHMM/), SplicePredictor (http://rgp.dna.affrc.go.jp/RiceHMM/), SplicePredictor (http://rgp.dna.affrc.go.jp/RiceHMM/), BLASTN and BLASTX. The genomic sequence was searched against NCBI NonRedundant Protein database, nr (ftp://ncbi.nlm.nih.gov/blast/db) and the cDNA sequence database at RGP or DDBJ Protein homologies of the coding regions were searched against NCBI NonRedundant Protein database with BLASTP. ESTs represent the identified cDNA sequences using BLASTN with the corresponding DDBJ accession no. and RGP clone ID. Full-length cDNAs represent the identified cDNA sequences using BLASTN with the corresponding DDBJ accession no.
